Nov 17, 2023

CONTENTS

- 1 apyshell package 1
 - 1.1 Subpackages 1
 - 1.2 Submodules 1
 - 1.2.1 apyshell.apyshell module 1
 - 1.2.2 apyshell.extensionapi module 2
 - 1.2.3 apyshell.extensionmgr module 3
 - 1.2.4 apyshell.support module 3
 - 1.3 Module contents 4
- Python Module Index 7
- Index 9

APYSHELL PACKAGE

1.1 Subpackages

1.2 Submodules

1.2.1 apyshell.apyshell module

apyshell - Python Embedded apy script runner

This script creates a framework for running lightweight scripts under the apyengine interpreter. It demonstrates embedding and controlling the engine. It can be run either stand-alone, or itself embedded into an application.

apyshell (*script*, *basedir*='/opt/apyshell/scripts', *extensiondir*='/opt/apyshell/extensions', *extension_opts*=None, *args*=None, *initscript*=None, *globals*=False)
Execute a script file under anyengine.

This is the main entry point.

Args: script : The .apy script to execute.

Returns: The return value. True for success, False otherwise.

savepid (*pfile*)
Save our current PID if we can.

Note: this doesn't do any checking of the file path. Take care if running under root.

usage ()
Help message.

1.2.2 apysheIl.extensionapi module

extensionapi - The interface between extensions and the engine.

An instance of this class is passed to the extensions at load time to give them an API back into the engine via the ExtensionMgr

Credits

- version: 1.0

```
class ExtensionAPI (eng, parent, internal=True)
    Bases: object

    getSysvar__ (name, default=None)
        Return the value of a system variable or a default

    getvar__ (vname, default=None)
        Return the value of a script variable or a default

    handleEvents (name, data)

    isDef__ (name)
        Return True is the name is defined

    listDefs__ (exception_list=None)
        Return a list of script def procs

    list_Modules__ ()
        Return a list of install_()-ed modules

    loadScript__ (filename, persist=False)
        Load and execute a script file

    logError (modname="", *args)

    regcmd (name, func=None)
        Add a new command callable by scripts

    registerCmds (mdict)

    setSysvar__ (name, val)
        Set a system variable

    setvar__ (vname, val)
        Set a script variable

    unregisterCmds (mdict)

debug (*args)
```

1.2.3 apysheIl.extensionmgr module

extensionmgr - Handles extension load/unload for apysheIl.

This script supports the extension handling commands for apysheIl.

```
class ExtensionMgr (eng, epath, options=None)
    Bases: object

    handleEvents (name, data)

    isExtLoaded__ (ename)
        Return True if an extension is loaded

    listExtensions__ ()
        Return a list[] of currently-loaded extensions

    loadExtension__ (ename)
        Load an extension by name (no paths allowed), and it has to be available in the extensions directory.

    register ()

    scanExtensions__ ()
        Return a list[] of available extensions

    scanForExtensions (dir, iflag)

    shutdown ()

    unloadExtension__ (ename)
        Remove a currently-loaded extension

quoteSpecial (orig)
```

1.2.4 apysheIl.support module

support - Various stand-alone support functions for apysheIl.

This file contains various utility functions used by apysheIl.

checkFileName (*fname*)

Check a file name

Checks the given filename for characters in the set of a-z, A-Z, _ or -

Args: fname : The name to check

Returns: True if the name is entirely in that set False if there were invalid char(s)

debugMsg (*source*=", *args)

enableDebug (*arg*)

errorMsg (*source*=", *args)

get_queue (*q*, *defvalue*=None, *timeout*=0)

getparam (*table*, *key*, *default*, *remove*=False)

retError (*api*, *module*, *msg*, *ret*=False)

sanitizePath (*path*)

Clean a path.

Remove dangerous characters from a path string.

Args: path : The strin with the path to clean

Returns: The cleaned path or None if there was a problem

setparam (*table*, *key*, *value*, *replace*=False)

swapparam (*table*, *oldkey*, *newkey*, *value*=None)

unlock__ (*lock*)

1.3 Module contents

ApyShell - Python Embedded apy script runnner

This package creates a framework for running lightweight scripts under the apyengine interpreter. It demonstrates embedding and controlling the engine. It can be run either stand-alone, or itself embedded into an application.

The companion project “apyengine” has documentation and examples of how to use the apyengine outside of this package. The entire apyengine package is included in this package for convenience. <<https://github.com/closecrowd/apyengine>>
